About Myself...

Name: Aryan Puri
Age: 16
Occupation:
Student, Grade 11 Cbse
Location:
New Delhi, India

I am currently studying in St. Columba's school in grade 11. I opted to take science to further enhance my skills and also plan on learning a bit about augmented reality in the coming years. I I enrolled in CleverEd to understand the workings of AI and how we can utilize deep learning to explore datasets ,how we can use deep learning ,finding neural networks etc.

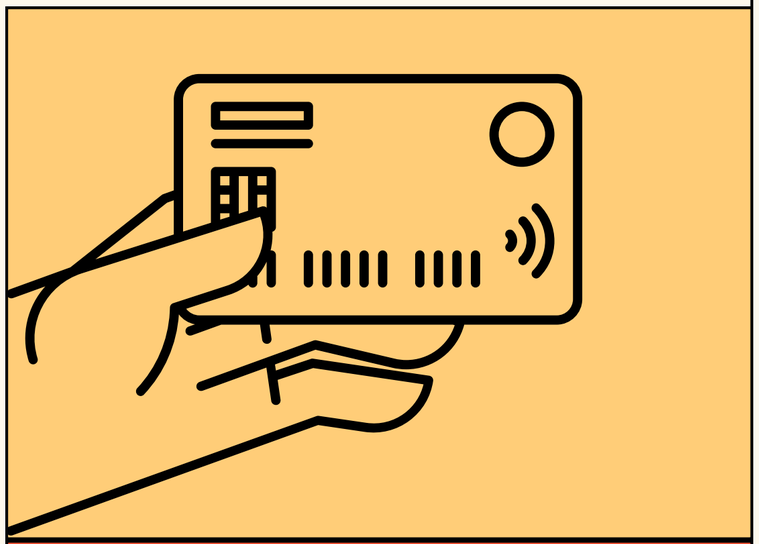
Personal Characteristics:	Hobbies and Interests:
• Creative and Reflective • Solution-oriented • Collaborative and Team-Oriented	• Reviewing tech • Acting • Computer Science • Designing
Goals:	**Currently thinking about**
• To understand and work on my future goals properly before i step out of school. •	Analysing the potential impact of quantum computing and interested to also understanding about quantum computing and AGI

Journey with Clevered

Avishek Sir's dedication and support were instrumental in developing our project Avishek sir always stayed by our side no matter how late it got, never stepped down on us, and was always ready to help us understand the project and work on it. Sir always explained complex concepts in a way that made them easy to understand no matter how long it took. It wouldn't have been possible to do this project without him.I would also like to thank my parents, Dr. ken and everyone who made it possible to provide me with this project

About the Project:- Credit Card Approval System

Description
It is a projct developed which helps the user by predicting the likelihood of the person getting a credit card based on various parameters.



- **The main aim of this project was to declutter the data and convert it into usable form (string to float form) and then train the data accordingly**

- The dataset on which the model was formed and trained was provided by kaggle

- Organizing data
- Building and checking the accuracy model
- Plotting Features (most important such as income years employed etc)
- Forming the front-end code

The User Interface of the Project →

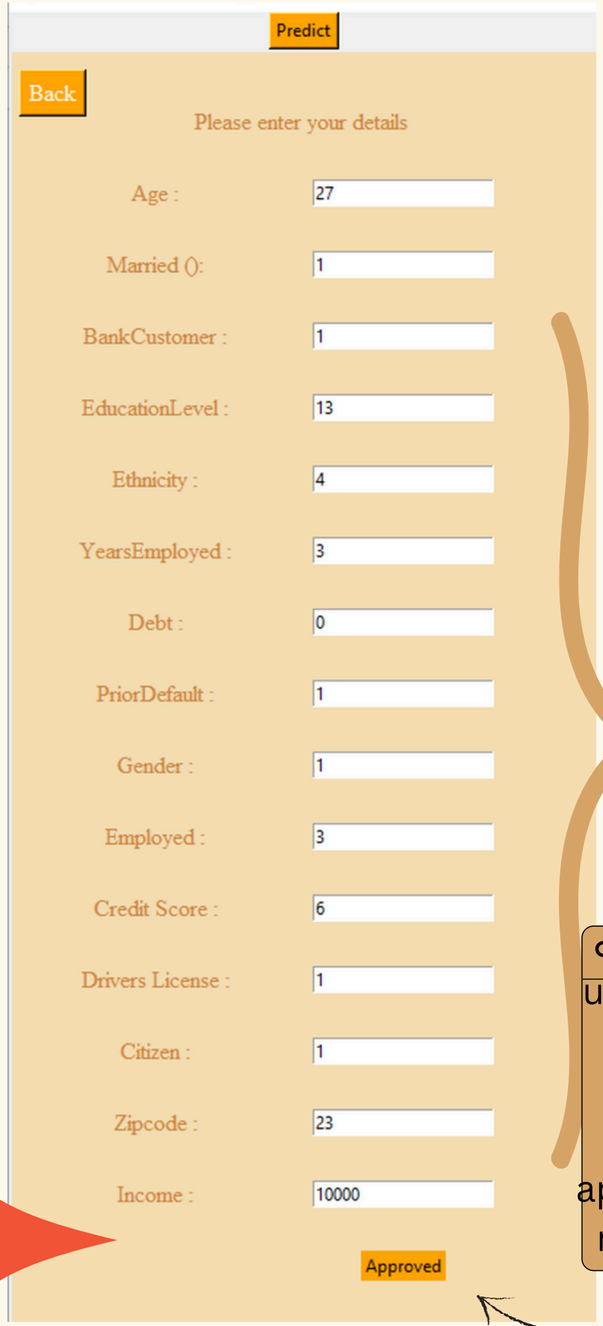
Visual view of the project: The User Interface

To start the prediction process (Front end made using Tkinter)

credits

This is the home screen menu which opens up when the program runs

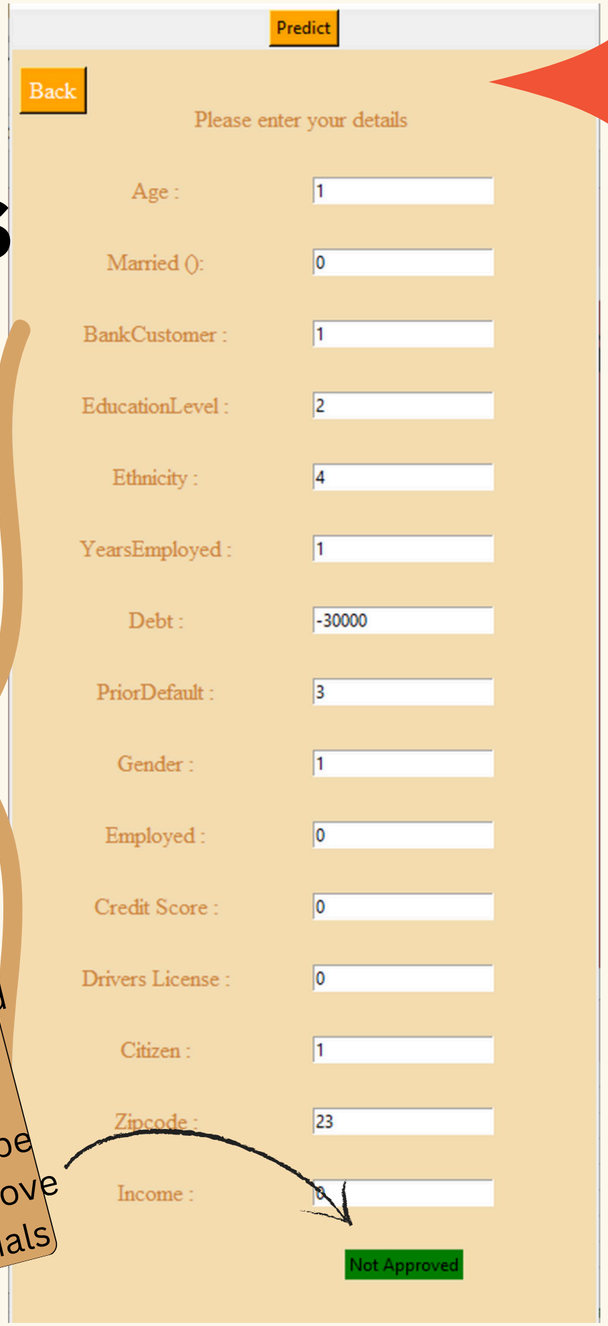
Examples:-
the input it takes



the parameters its takes for assesment by the trained model(only in float/ integer values)

using the input data and then using a random-forest classifier it suggest it would be approved with the above mentioned credentials

using the input data and then using a random-forest classifier it suggest it would not be approved with the above mentioned credentials



with thanks

I would thank everyone present here who were a part of and who went through and understood my project.

For any queries, feel free to contact :) :-
